

1. SPRINT 1 BURNDOWN CHART SIMULATION

2. ANSWERS TO REFLECTION QUESTIONS

- Q1: Did your estimations reflect the actual effort?**
- Answer:** Yes. Estimating with Planning Poker using the Fibonacci sequence (1, 2, 3, 5, 8) accurately captured the non-linear risk and complexity of financial exchange logic. Straightforward tasks like balance display (STORY-1.2, 2 pts) finished swiftly, while high-stakes stories involving dynamic pricing slippage and atomicity (STORY-2.1 & STORY-2.2, 5 pts each) appropriately utilized their allocated effort buffer.
- Q2: Was your backlog well-prioritized?**
- Answer:** Yes. Backlog prioritization strictly respected functional prerequisites and user value. In Sprint 1, we prioritized point aggregation and token conversion (Epics 1 & 2), establishing the core liquidity layer. Without aggregated points and converted tokens, gift card redemption is impossible. Thus, security locks and merchant settlements (Epics 3 & 4) were naturally sequenced for Sprint 2, eliminating dependency blocking.
- Q3: How did your simulated sprint align with your plan?**
- Answer:** The simulated sprint achieved 100% completion of its 15-story-point commitment within the 1-week timebox. Although Day 2 experienced a minor lag during merchant API credential integration, the completion of Story 1.1 and 2.1 on Days 3 and 4 re-aligned team progress directly with the ideal linear burndown guideline. Firm scope control ensured zero mid-sprint scope creep.
- Q4: What insights did the burndown chart give about your team's capacity?**
- Answer:** The burndown chart highlighted three crucial capacity insights: (1) A team velocity of **15 to 18 story points per 1-week sprint** is sustainable and prevents burnout; (2) Story points burn down in a realistic step-wise pattern as items meet full Definition of Done (DoD); and (3) Granular task decomposition (2 to 5 points) avoids hidden progress blockers.
